Research Presentation Guidelines

Goal: Present your research project to the class! You will need to put together a PowerPoint presentation that summarizes your research proposal and anticipated findings.

Some basic reminders:

- Your presentation should highlight the main points of your study (See below for specifics on what's expected).

- You should aim for approximately ten minutes presentation time (you'll want to leave time for questions!). Depending on how fast you speak, 10-12 slides should be sufficient. You will lose points for being substantially under-time but also for being over-time!

- Your presentation will closely follow your paper. Think of the presentation as you highlighting the major components of the paper. Your presentation should provide your audience with the background information required to understand your research project, explain your research project/hypotheses, provide a step-by-step guide as to how you plan on conducting it, and provide the expected results.

    - DON'T JUST COPY PARAGRAPHS FROM YOUR PAPER ONTO THE SLIDES! Break up text, rephrase for concision, and use bullet points! Animations can also be fun for guiding your audience, just don't over do it!

- Part of your project grade is attendance for other students' presentations AND peer feedback! Just because you have already presented doesn't mean you should just stop showing up!

Components of the Research Presentation

<u>To receive full credit, make sure to include the following sections in your presentation!</u>

<u>1) Title Slide</u> This can just be your paper title. It's also nice to include your name on this slide.

<u>2) Introduction/Literature Review:</u> Give me the background on your project. Your first slide should introduce your topic. Next, provide two or three slides that quickly summarize previous studies in your area. What did they find? Are there any inconsistencies in previous work (i.e., do some studies contradict each other?) (This should mirror your paper – basically take the paragraphs and turn them into bullet points!)

The introduction will most likely be the longest portion of your presentation. I would suggest making this about 3-5 slides total (aim for about 5 minutes of presentation time)

3) The Present Study: After the introduction slides, you should have one more slide that states your current research question and your hypotheses. What is the goal of your study? Be sure to also state your hypothesis -- what specifically do you expect to find?

4) Method: Your method section will detail how exactly you plan to test your research question. It will consist of the following three sections:

- **4A) Participants:** Who is your sample? (Where are you recruiting them from? How many participants are you planning to recruit? How will they be compensated?)

- **4B) Materials:** What will you be using? Describe any surveys, tests, instruments, etc. in this section
    - **Be sure to provide specific examples!** Where will survey questions come from? What type of scale would you use? What are some examples? Cite anything that comes from another researcher!

- **4C) Procedure:** Give me a step-by-step description of how you plan to conduct your study.

At minimum, your method section (with all 3 sub sections) should be three slides (one slide per subsection) (Again, these should mirror your paper)

5) Anticipated Results: What do you expect to find? Specifically what pattern of data would support your hypothesis? (For example, if your hypothesis is that sleep deprivation would lead to worse test performance, tell me that sleep deprived participants would score lower on whatever test you are using compared to well rested individuals) This section should be at least half a page. **YOU DON'T NEED TO REPORT ANY STATISTICS! (YOU AREN'T COLLECTING DATA!).** Instead, this section should just be predictions! Think about general patterns of results!

This can be one or two slides – feel free to make graphs! It is perfectly acceptable to make a bar graph depicting the pattern of results that you expect to find! Depending on your design, this section should be 1 or 2 slides and should take about a minute or so to cover

6) Conclusion: Your last slide should summarize your main points. You should also include a take-home message about why your study is important. Why does this study matter?

7) Your last slide should be a "questions" slide
