Exam 1 Review Guide

Chapter 1

- Why is psychological measurement important?
- Be familiar with some of the real-life implications of testing that were discussed in lecture
    - What problems arise if measures are inaccurate?
- What is the link between observable behavior and unobservable psychological attributes?
- What is the formal definition of a psychological test?
    - What are the three components according to Cronbach?
- Know the difference between psychometrics and testing!
- Be familiar with the challenges that are unique to psychological measurement
- Why are individual differences so important for psychometrics?

Chapter 2

- Know the definition of measurement.
- Know the three properties of numbers.
- What are the specific issues surrounding the number 0?
- How are psychological measures “arbitrary”? How does their arbitrariness differ from physical measures.
- What is additivity? Be able to provide an example.
- What is scaling?
- Who was Stanley Stevens? What was his contribution to measurement?
- Know the four scales of measurement. Be able to list them AND provide examples of each

Chapter 3

- Why are differences so important for measurement?

- Know the definitions for interindividual and intraindividual differences. How are these differences tested for?

- What is variance? How does variance differ from covariance?

- What are the three measures of central tendency?

    - Be familiar with the mean formula.

- What are the two factors that influence the size of variance?

- Be familiar with associations and correlations!

- What are z-scores? When are they used and what extra information do they convey?

Chapter 4 (Part 1)

- What is “test dimensionality”? What does it mean for a test to be “unidimensional” vs. “multidimensional”?

- What are composite scores? How are they generated?

- What does it mean for test dimensions to be correlated? What about uncorrelated? How does treatment of correlated vs. uncorrelated dimensions differ?
