Exam 4 Review Guide

Chapter 12

- What is the goal of correlational research?
- Know that correlations test for pre-existing relationships between variables
- How does correlational research differ from experimental research?
- What is the correlation coefficient (Pearson's r)? Be able to interpret it!
- Regarding correlations, what is meant by the terms *magnitude* and *direction*?
- What is regression?
- Regarding correlations, what is the third variable problem?

Chapter 13

- What is the goal of descriptive research?
- What is observational research?
- Know the problems inherent to observational research
- What is inter-rater reliability? How can it address problems with observational research?
- Be familiar with the various types of observational studies we discussed in this chapter.

Chapter 14

- What are single case research designs? When are they most likely to be used?
- What is an ABAB single case design?
- What are potential limitations of the ABAB design?
- What is a multiple baseline design?
- Be familiar with the general and weaknesses of single subject designs

Survey Slides

- What are latent variables?
- What are double-barreled questions? Why are they problematic?
- What is an ideal response rate for surveys?
- Why are interviews generally more effective than surveys?
- Be familiar with the strengths and weaknesses of survey research?
- What is response bias?
- What are the potential ethical problems regarding survey research?

Other Important Things you should know for this Exam!

- Research Ethics (specifically ethical treatment of participants)
- Within vs. Between Subject's designs
- Correlations vs. Experiments (which can be used to determine cause and effect and why?)
- Internal vs External Validity
- Operationalizing variables
