PSYC 4503 Final Presentation Guidelines

Goal: Present your questionnaire AND your results to the class! You will need to put together a brief PowerPoint presentation that summarizes the psychological construct you chose to measure, the three dimensions that you believe underly it, how you validated your instrument (factor analysis!), basic descriptive statistics (means, sds, min, max for all subscales), and reliability (Chronbach's alpha)!

Basic Reminders:

- Your presentation should highlight the main points! You only have 10 minutes, so make them count! Your talk should:

    1. Provide your audience with enough background information to understand your questionnaire, provide a brief overview of what

    2. Explain *why* it is important to research this construct

    3. Explain the hypothesized number of factors that make up this construct

    4. Briefly summarize what you found.

    5. Provide a conclusion

- Part of your project grade is attendance during your classmates' presentations AND providing feedback! Just because you have already presented doesn't mean you should stop showing up to class!

Components of the Presentation

<u>To receive full credit, make sure to include the following sections in your presentation!</u>

<u>1) Title Slide:</u> What are you calling your instrument? Whatever you choose to call it the title should reflect your instrument's general purpose. It's also nice to include your name somewhere on this slide.

<u>2) Introduction/Literature Review:</u> Give me the background on your project. Your first slide should introduce your topic. Next, provide two or three slides that quickly summarize previous studies in your area. The main point here is to explain what your instrument is measuring and why this matters. Your introduction should summarize at least **three** studies published in peer reviewed journals. If you aren't sure whether a study is peer reviewed, just ask me!

3) The Present Study: After the introduction slides, you should have one more slide that states what your instrument measures and your proposed structure. How many factors do you think this construct is?

4) Method: Your method section will detail how you tested your research question. It will consist of one section:

- Participants: Who were your participants? How many people took your survey? Did you exclude any outliers?

- **4B) Materials:** Describe the instrument here!

    - Be sure to provide specific examples of at least one item per construct**!**

    - What kind of scale did you using? (Binary, Likert, etc.)

    - How many total items do you have? How many per factor?

- **4C) Procedure?** Don't worry about this section – everyone's procedure will be basically the same!

5) Results: What did you find? Specifically, how many factors is your construct based on your results? You should talk about running the factor analysis here. Also report descriptive statistics (mean, sds, min, and max for each subscale), correlations between factors, and split-half reliability (Cronbach's alpha).

6) Conclusion and take-home: What do your results mean? Is your instrument reliable? Was your hypothesized structure correct? What is the take-home message?

7) References: APA style citations please!

8) Last slide – questions slide!

How to record your presentation

Option 1: PowerPoint

1. Click “Record” in the top menu (next to “slideshow”)

2. Click “From Current Slide”. This option will allow you to record audio individually for each slide.

3. When you are ready, click the red record button and begin speaking after the countdown. This usually works best if you have a slight pause before you begin speaking.

4. Pause the recording when you have finished presenting the slide.

5. Repeat this process for each slide in your presentation.

6. You can confirm that a slide has audio by checking whether it has a speaker icon (usually in the bottom right corner of the slide).

7. After you have finished recording all audio, click “Export to Video”

8. Click “Customize Export”

9. Make sure that “Use Recorded Timings and Narrations” is selected (This should be the default option)

10. Change the video quality to “Standard 480p” (This will help keep your file size small for uploading)

11. Click “Create Video”

12. Finally be sure to confirm that everything recorded correctly before submitting

Option 2: Zoom

1. Download Zoom and create a free account if you do not already have one (https://www.zoom.com/?lang=en-US)

2. Open zoom.

3. Open your presentation in a new window.

4. Navigate back to zoom. Click “More” (bottom right-ish) and then “share” to share your screen. Select your presentation as the window you are sharing.

5. Click “More” one more time. Select “Record” and choose “record to this computer”

6. Recording will start immediately, so be ready to go as soon as you click record! I would also suggest turning off your camera and minimizing the box prior to recording.

7. Present your project! In my experience, its best to do this in one go rather than stopping and starting.

8. When finished, end the recording (“More” → “Stop Recording”)

9. End the meeting. A .mp4 file will be generated. Note that this process may take some time depending on how large the video file is.

10. Select where to save the video to. By default, zoom will select the “zoom” folder (inside of the documents folder. To make things easier, I recommend saving it directly to the desktop.
