Tests & Eval Exam Review 3

Chapter 10

- What is *response bias*? Why is it problematic for test design?
- What are the three main types of response bias (slide 3)
- Be familiar with the various factors that affect response bias (slide 4)
- What is *Acquiescence Bias*? How can test-designers account for this type of bias?
- What is *Social Desirability Bias*? How can test-designers account for this type of bias?
    - What factors affect social desirability? (slide 9)
- What is *malingering*? When is this most likely to be an issue? (slide 11)
- What strategies can be used for coping with response bias? (slides 15 – 21)

Chapter 11

- What is *test bias*? How does test bias differ from response bias?
- What are the two types of test bias described on slide 3? Be able to provide examples of each.
- Why is test bias such an important issue? (slide 4)
- Be familiar with item-response theory and item-characteristic curves (slides 8 – 13). You don't need to know the math behind ICCs, but do know the general theory (i.e., what do the curves plot, how are they interpreted, etc.)
- Which type of test bias do ICCs test for?
- What is linear regression? How is regression used to test for predictive test bias? (Again, don't need to know the specific math, but do know how to interpret slopes and intercepts, etc.) (slides 17 – 22)
- How is test bias related to test fairness?

Chapter 4 (part 2) and Chapter 12 (Factor Analysis)

- What is dimensionality? (Be able come up with your own examples of uni- and multidimensional tests) (Slides 2 – 5: this was also covered in the first part of Chapter 4)

- What is *factor analysis*? You should be familiar with:
    - The two main types (slide 7)
    - Which one is more commonly used in psych
    - Why each one is used (also take a look at the Chapter 12 slides)
- What are *factors*? (slide 12)
- What is the relationship between variance and factors (see the fun illustration on slide 13)
- Be familiar with the various ways to determine the number of factors to include in the analysis (slides 14 - 19)
- What are factor loadings? Be familiar with the guidelines for interpreting loadings (slides 25 – 29). What should you do with "bad" items (i.e., items that don't cleanly load on one factor)?
- What are fit indices? What do these values tell us about factor analysis models?
    - What are the two main types? (slide 33)
- What is confirmatory factor analysis? (CFA) How is it different from EFA?
    - When should each be used (slide 2)
- CFA is an iterative process. What does that mean?
    - What are the steps on slide 5?)
