PSYC 3233 Exam 2 Topics

Chapter 4

- What are neurons? Be able to draw one and correctly label the dendrites, axon, cell body, and terminal
- Be familiar with the four lobes of the brain. What is each lobe responsible for?
- What is lateralization of the brain? What processes are associated with the left and right hemispheres?
- What are reflexes? Be able to list the basic infant reflexes that we discussed in class
- Be able to describe the difference between gross and fine motor development (slide 10)
- Know the difference between sensation and perception
- What is the visual cliff experiment? What does this study reveal about depth perception?
- What is attention? Why is it so important for development? (slides 28 - 32)
- What is Alzheimer's Disease?
- Why are drug treatments for Alzheimer's largely ineffective?

Chapter 5

- What is the biopsychosocial model of health?
- What are the most common causes of infant mortality?
- Be familiar with infant sleep patterns
    - What is REM sleep?
    - What is Sudden Infant Death Syndrome (SIDS)?
- Be familiar the various types of child abuse discussed on slide 7
- Know the difference between Anorexia, Bulimia, and Binge Eating Disorder
- Be familiar with the leading causes of death in childhood, adolescence, and adulthood

- What is the relationship between stress and illness?
    - Be able to describe Cohen et al. (1998) (slide 22)

Chapter 6

- What is cognition?
- Be familiar with Piaget's approach to studying development
    - What are schemes?
    - What is Adaptation
        - How are assimilation and accommodation related to adaptation?
    - What is equilibration?
- Know Piaget's four stages of cognitive development:
    - Be able to name the stages, provide the age ranges, and give a basic description of each stage
- What is object permanence? At what age is it thought to be fully developed by?
- Be familiar with some of the shortcomings of preoperational reasoning (slides 17 and 18)
    - What is the three mountain task? What does this task reveal about preoperational reasoning?
- What are the qualities of concrete operational reasoning? (slide 19)
- What is social cognition?
- What are Piaget's major contributions to the study of cognitive development?
- What are some common criticisms of Piaget's approach?
- Be familiar with Vygotsky's Sociocultural Theory (slide 25)
    - What is scaffolding? How does it assist children?
    - What is the Zone of proximal development?

Chapter 7

- How do psychologists define memory?
- What is the information-processing approach to studying cognition? (slides 3 and 4)
- Know the difference between the various memory processes discussed on slides 5 and 6 (encoding, consolidation, storage, and retrieval)
    - Know the two types of retrieval discussed on slide 6
- Be familiar with the following types of memory:
    - Sensory memory
    - Working memory
    - Long-term memory
- How is attention related to memory?
- How is memory studied in infants? (slide 9)
- How does long-term memory change over the lifespan?
- What are metamemory and metacognition?
    - How do metamemory/metacognitive strategies change over the lifespan?
- What is theory of mind? How is theory of mind studied with infants? (slides 17 and 18)
- Why does memory decline with age? (slides 25 – 28)
